From UCCX and UCCE

There is no import button. Rebuild the domain, then move a number.

1. **There is no import button** This track is a teaching bridge. Five9's public pages name Cisco as a SIP gateway type. They do not publish a wizard that reads a UCCX script or a UCCE dial plan and emits a domain.
2. **CSQs, skills, and the partition you will not find** In this teaching map, a UCCX contact service queue is closest to a Five9 skill group: the people who can take that work. A UCCE skill group is a similar idea with a different name. Precision queues and attributes do not have a one-field equivalent you should invent.
3. **Scripts are rebuilt in modules** A UCCX script is a document in Cisco's editor. A Five9 IVR script is a chain of modules from the IVR Administrator's Guide: Menu, Get Digits, If/Else, Skill Transfer, Play, and the rest of that chapter. The lab's builder speaks those names and exports a learning JSON that VCC will not import.
4. **Dialing modes do not survive the move by osmosis** UCCE outbound has its own pacing words. Five9's product pages talk about Preview, Progressive, Power, Predictive, and Manual Touch. The simulator in this lab is a classroom clock, not either vendor's algorithm.
5. **Numbers, lists, and ANI are a data project** DNIS values, calling lists, dispositions, and do-not-call entries are domain data. They are not inside the Cisco script file. A cutover that moves only the IVR still has nothing to dial and nowhere legal to send a call.
6. **The gateway cut, without pretending to be the CUBE guide** When the third SIP story is a Cisco gateway, the technical requirements are still the Five9 side: DNS SRV preferred, G.711 as the default codec, TLS 1.2, no double NAT. What the gateway itself must rewrite — number format, a normalization script, early media — lives in Cisco's documentation.
7. **Cutover morning is a checklist, not a mood** The morning the numbers move, the domain should already contain skills, a script, a running inbound campaign, loaded lists, dispositions, DNC, an assigned profile, and a desktop the agent has signed into. E911 addresses have to be dispatchable for the place the agent actually is. A stale office address is not a courtesy.

Confirm before relying.

A note from the student behind this lab

This is an **independent, free, learning-only student project**. It respects every company and vendor, and every trademark belongs to its owner. It is **not**

affiliated with or endorsed by any of them.

If anyone has a concern, the content will be removed or corrected promptly via the contact form at https://cyphermonkeylabs.com/#contact. Nothing here is sold. Happy to volunteer for any organization.

Confirm before relying on a number, a port, or a vendor case-study claim. Product behavior belongs to the cited page.
