Domain: The VCC tenant. Skills, users, lists, and campaigns stay inside it.
Skill group: Agents or supervisors who can take a campaign's work. A user and a campaign can have more than one.
User profile: The permission template for a person. Not a campaign profile.
Campaign profile: Overrides defaults such as ANI. One profile is assigned to a campaign. The same profile can be reused.
Campaign: Inbound, outbound, or autodial. Blended is staffing language, not a fourth type.
DNIS: The number an inbound campaign answers. A stopped campaign does not answer.
Disposition: The outcome code on a call. Final disposition stops the other numbers on that record for the campaign.
List penetration: The default list walk: first number on every record, then the next number.
Vertical dialing: Finishes the numbers on one record before moving on. Community notes say the compass wording is easy to misread.
Preview: The agent sees CRM history before the dial.
Progressive: The outbound page describes one customer call per available agent. The dialer page also says adaptive pace. Quote the page you mean.
Power: A configured number of calls per agent, with an abandon throttle.
Predictive: Algorithmic pacing. Product guidance talks about teams larger than about ten agents.
Manual touch: No automatic dial. TCPA manual touch adds typing, blocks paste, and enables Dial on a match.
Max Abandoned Call Percentage: A campaign field with a warning if you change it. This lab does not state a numeric default.
IVR module: A named block in the IVR Administrator's Guide, such as Menu, Play, If/Else, or Skill Transfer.
Skill Transfer: Sends the call toward one or more skills. No skill selected means the Default queue in the community write-up.
Default queue: Where a Skill Transfer with no skill goes, per the community article.
